

Phase 4 End-to-End Test Report

Photocopy, revaluation, recounting, and admin workflow

FINAL RESULT **PASS - tested local Phase 4 flow**

The local backend flow is green. The official university photocopy API was exercised over HTTP, followed by admin approval, protected copy download, university acknowledgement, and delivery audit evidence. Revaluation and recounting rules also pass, including independent evaluator allocation.

Test summary

Area	Command / check	Result
Phase 4 backend	python manage.py test apps.phase4	12 passed
Full backend	python manage.py test	153 passed
HTTP photocopy lifecycle	Official portal -> admin -> delivery	Passed
Focused browser	playwright phase4-navigation.spec.ts	1 passed
Focused frontend lint	Phase 4 workspace files	0 errors

HTTP photocopy proof

1. Official portal POST creates status **requested**.
2. Admin approval changes status to **approved**.
3. University download returns HTTP 200 and **evaluator_marks_included: false**.
4. University acknowledgement changes status to **delivered**.
5. Audit event **student.copy.delivered** is stored.

Revaluation and recounting proof

Revaluation status: **requested -> approved -> assigned -> evaluated -> decided -> closed**. The tests confirm locked final mark, finalized script, complete masked pages, previous-evaluator exclusion, independent assignment, locked new result, final mark update, and close audit evidence.

Recounting requires selected-question scope, question IDs, and recounting notes. A full-script recounting request is rejected.

Bugs fixed during testing

Issue	Resolution
Incomplete Phase 4 fixture	Added finalized script, master/evaluation assets, previous assignment, locked evaluation, previous valuation result, and locked final mark.
Photocopy fixture had one page only	Created an active evaluation asset for every page before testing eligibility.
Wrong audit assertion	Aligned the test with the API event contract: student.copy.delivered.
Browser selector ambiguity	Targeted the Application requests heading instead of matching both tab and heading.

Files changed

- backend/apps/phase4/tests.py
- frontend/e2e/phase4-navigation.spec.ts
- docs/phase4-automation-testing-guide.md
- output/reports/phase4-automation-test-report.md

Remaining note

The broad legacy e2e/operations.spec.ts suite still has unrelated failures in tenant routing, platform audit navigation, digitization expectations, and evaluator resume state. Those are outside the focused Phase 4 pass. Production certification still requires staging credentials and staging script data.

CERTIFICATION

Local Phase 4 automated flow: PASS
